# Getting Started

Overview   Hosted Flow   **Embedded Flow**   Mobile SDKs   Server APIs

Embedded Flow

With the embedded flow (React SDK) integration method, you can embed an information collection experience and parallel Verifications (configurable through an Inquiry Template) in your web application, and dynamically create an individual Inquiry to later review the associated information collected and verification results.

How to use this method

Step 1 Select your Inquiry Template

Select the Inquiry Template you would like to use from the dropdown below. The Inquiry Template determines what information is collected and which Verifications you'd like to run on the data that is collected.

If you would like to create a new Inquiry Template (and you subscribe to a plan that allows you to create your own Inquiry Templates), open the Inquiry Templates page in your Dashboard and then come back to this page.

Inquiry Template
